

ABSTRACT

To provide a watch with opening/closing lid, whose external appearance can be improved, in which clothes and the like are not caught by an end portion of a spring biasing the opening/closing lid, and in which a biasing function for the opening/closing lid by the spring can be maintained. A premise is a watch in which a front lid is attached to a case band of a timepiece armor main portion through a pivot axle so as to be openable/closable, and this front lid is biased in its closing direction by a spring. The front lid is provided with an axle fitting portion rotatably fitting to the pivot axle. A spring accommodating hole facing the axle fitting portion is provided in a position biased by a deviation dimension D from an axle center C of the pivot axle of the case band. A coil spring is used for the spring. It is characterized in that this spring is accommodated in the spring accommodating hole under its compressed state, and a spring force of the spring is given to the axle fitting portion, thereby biasing the front lid in its closing direction.
